

Assume `html_code` is a variable passed from the Flask app, containing this string:

```
<div><p>This is a <strong>Test</strong>.</p></div>
```

Look at what happens when we run the following in a Jinja template **with autoescaping disabled**:

With Flask + Jinja, autoescaping is **enabled** by default in templates ending in `.html`, `.htm`, `.xml`, and `.xhtml`^[1].

It is disabled in all other templates.

As an aside, using `{% raw %}` will prevent the Jinja code being executed.

```
{% raw %}
  {{ html_code }}
{% endraw %}
```

→

```
{{ html_code }}
```
